

1 Abstract of Disclosure

2 A selective one-way wrench includes a handle, an annular head, a gear, a
3 direction controller and a direction switch. The handle projects from an
4 annular head. The annular head defines a first space and a second space
5 communicated with the first space. The gear is rotationally put in the
6 first space. The gear includes a toothed external face. A direction
7 controller is put in the second space. The direction controller includes
8 two pawls and a spring installed between the pawls. Each of the pawls
9 includes a toothed face. The direction switch includes a first element
10 installed rotationally on the handle and a second element put in the
11 second space and operably connected with the first element for bringing
12 the toothed face of selective one of the pawls into engagement with the
13 toothed external face of the annular gear.
